Press the shutter button halfway down, and the sensor in the focused area illuminated briefly in red to indicate where the focus is. Focus indicator Looking into the viewfinder or pressing the shutter button halfway down triggers the autofocus system. When the indicator flashes, you cannot release the shutter. Antishake systems compensate for the minor movements a camera makes when you're holding it in your hands, resulting in clearer photos. This dust shows up in every photo that you take. With the Sony, the autofocus engages the moment you bring the camera up to your

Simply put, the camera can't capture the same range from light to dark that your eyes can see. Extended dynamic range is an attempt to produce better detail in shadows without washing out highlights. With many other digital SLR cameras, it's pretty easy to tell which features stand out from the crowd. I wanted to capture a few to see how the A100 handled their colors. Why would they build antishake into a camera when they'd rather have you buy an expensive lens? If you're more of a photography traditionalist, then take a look at the other options out there. This is why I don't recommend this particular camera for the technophobic. I didn't ever have the feeling that the camera would drop out of my hand. Let's say that you're photographing your dog in the backyard. You start off with a slow shutter speed, but need a faster one to capture the action. Take a look at the visual digital SLR dictionary or the 5 online SLR lessons. Just a word of caution if you do get carried away setting color modes, make sure you check the setting before you start taking photos. This means that anything can set off the autofocus your hand, arm, head or chest. For even more sample A100 photos, take a look at my Sony A100 Photo Gallery. This means that the camera is almost new, and exhibits no signs of wear and tear. If there are other links that you'd like to see here, please send your feedback and let me know. Here you go Current Issue. It's great anywhere a tripod is unavailable, or in museums where flash is prohibited. It also makes the camera perfect for indoor sports shooting, and candlelit subjects that would be ruined by flash. At the heart of the camera is the advanced Bionz Image Processor, using hardware-based Large Scale Integrated LSI circuitry that responds ten times faster than software image processors improving camera response time, handling Dynamic Range Optimization processing and extending battery life.

EyeStart Autofocus System Most cameras don't start focusing until the shutter button is half-pressed, but that can slow down camera response. SuperAccurate Exposure Control A 40-segment honeycomb sensing system provides multipattern measuring for superior exposure control accuracy. There are also a series of scene modes available for great exposure even under difficult lighting situations. Lithium Ion Battery with Stamina Power Based on CIPA standard, the supplied NPFM55H Lithium Ion rechargeable battery lets you take up to 700 shots on a full charge, and recharges quickly with the supplied battery charger. In 35mm equivalent, it covers wideangle 27mm to 105mm midrange telephoto for snapshots, portraits, interiors and more, making it an excellent all-around lens to travel with. It introduces Sony imaging innovations like high-sensitivity shooting with Super SteadyShot in-camera image stabilization, Dynamic Range Optimizer to automatically increase detail in bright and dark picture areas, new AntiDust technology to keep the CCD imager clean for better pictures, and EyeStart Autofocus system for faster camera response. It also builds on a two-decade legacy of Minolta photographic leadership, accepting millions of Amount lenses sold worldwide. Super SteadyShot Optical Image Stabilization When you shoot with high sensitivity, the shutter remains open long enough to compensate for shaky hands or fast-moving subjects, the Sony Super SteadyShot system automatically reduces image blur. And because it works in-camera, you'll get the benefit of Super SteadyShot stabilization with every lens you use. To reduce blur and increase response time,

an EyeStart Autofocus sensor begins the DSLRA100s precision autofocus adjustments the moment you bring your eye to the viewfinder. Jack 4.0 out of 5 stars Although the megapixels were nearly the same as my cell phone iphone 11, equipped with a decent lens this camera did the job.

I really like this model,Sony has come out with other versions, based on this one, which are slightly better,however,if you have one of these,or want to buy a used one dont hesitate,it is an excellent camera for all around basic photographyThe Sony A100 has excellent image quality, user friendly menus and controls, and feels great in the hand. I was also able to buy much higher quality used lenses than I could afford with the Canon, and of course all of my lenses benefit from image stabilization. With my old system, I had to choose between buying a fast f2.8 lens or a lens with image stabilization. There was no way I could afford both in one lens. With the Sony I was able to purchase a fast lens and get the Stabilization through the camera body The best of both worlds!. Also, the used market for high quality Minolta lenses is fantastic. I highly recommend this camera. And for the price, the kit lens is an excellent deal as well.Its a dream to use, and the pictures are stunning. Since its based on a Minolta design, it accepts the lenses from my old Minolta Maxxum 9000 circa mid 1980s. This is a huge benefit to me; I now have an excellent quality 70210mm zoom lens for my new Alpha100 for no additional cost. The autofocus and TTL metering work properly, and since the antishake hardware is in the camera body, that works with the old lens also. Even my old Minolta cable release a switch on the end of an electrical cable with a proprietary rectangular plug connects and works fine. Im very happy with the camera. That said, there are a couple of annoyances. One of them might be significant to you, depending on how you want to use the camera. First, noise. Not picture noise, as in grainy lowlight photos, but acoustic noise. If you want to be an unnoticed photographer taking discreet pictures like CartierBresson with his Leica, this isnt your camera. Second, the lens shade. This is a nit, but I find it more clumsy to use than the lens shade on the old camera.

The old one was held on by a spring clasp; you just squeeze on opposite sides to install or remove it, or to reverse it for storage. The new one has to be positioned precisely so that tabs will lock into place when it is turned. Not as quick or as easy to use, but not really a big deal. I suppose it saved a couple of dollars, as the new one is one piece of plastic while the old one had several parts. On the whole, an excellent product. Id buy it again in a heartbeat.I love it and the reason you will too it is fast. Even with flash, you can just keep clicking and taking pics. One big difference with this SLR your eye WILL be looking through the eyepiece, and not at the 2.5 inch screen, because there is no image preview on the screen. But now, you WILL take good pictures in good light because you wont be depending on a washed out lcd screen in bright sunlight to see what you are capturing. At this price, get one today.The first had some limitations like the lcd resolution and the last was a little expensive. When I saw that Sony had bought Konicas Digital Camera technology I couldnt believe that a camera with so many resouces could cost 1000 bucks. Taking advantage of being in US and of the Prime benefits, I decided to buy the first release and so far I have absolutelly no complaints. I have taken many great pictures so far with the 1870 mm that comes with the camera and with my old lenses that I used to use with my old Maxxum 5. The antishake technology is unbelievable. Allows great zooms with image perfection.They work fine even the 50mm stock lense that came with the Maxxum 7000 that I started with. I have shot some photos using the old lenses and the new one

that came with the camera 1870mm. I like the camera very much and it fits really nice in my hands. I have not had the chance to really push the limits of the camera but I really don't do that anyway, so the camera fits my needs. To get the full experience on Sony.co.uk.

However, the A100 gives you lots of versatility with your lighting choices, not the least of which is the camera's built-in wireless remote capability for firing multiple flashes without wires. You'll also learn how to use the camera to fire studio strobes without wires. Even the little pop-up flash is amazingly versatile because you can control just how much fill flash to use in any given lighting situation. Using the Built-in Flash The flash you're likely to use most often is the one that's built into the camera. Why? Because it's the one you always have with you. Be advised, however, to use it as the sole light source only when you really have no other choice; direct, on-camera flash usually produces hard, unflattering shadows and red-eye. Most folks use the built-in flash in their cameras any time they have doubt about whether there's enough light for a decent exposure. You really don't need to do that with your Sony, thanks to the built-in image stabilization that works with every lens. Before you use the flash, make sure the Super Steady Shot feature is turned on. You'll probably get a good, naturally lit shot that has no red-eye. Check the viewfinder. To get the full experience on Sony.co.uk, please change your settings to allow JavaScript. The Exposure Mode dial on top of the camera sets the main shooting mode, with the following options: A Bulb shutter setting also becomes available in this mode, allowing variable length exposures for as long as you hold down the shutter button. Turning the Control dial with or without shifting the Exposure Compensation button cycles through a range of equivalent exposure settings, enabling the Program Shift mode. The left and right arrow keys scroll through the images on the card, and the up arrow displays a histogram and information display and the down arrow rotates the image. You can enlarge captured images or display them in an index format for quick viewing. The following options are available in most camera modes as menu tabs at the top of the display: Choices are 3,872 x 2,592 pixels Large; 2,896 x 1,936 Medium; and 1,920 x 1,280 Small. RAW captures the data directly from the CCD, and losslessly compresses it. Display times include 10, five, or two seconds. Options are ADI Flash, which uses distance information from the autofocus system together with a preflash to determine flash exposure, or Preflash TTL, which uses only the preliminary metering flash to gauge exposure before the shutter opens. This selection lets you choose whether to print the current photo, all photos, or only marked photos. The AF option will not release the shutter unless focus is set, while the Release setting trips the shutter even if AF is not established. Options are Focus Hold locks the lens and Depth of Field Preview previews the depth of field in the viewfinder. If active, the viewfinder display only enables when your eye is in the viewfinder. Date format integrates the current date into the folder name, to help keep track of images on your computer later. If you have more than one folder defined, this menu selection lets you choose which you want to use to save photos in. Times are 5, 10, 30, or 60 seconds. Options are 1, 3, 5, 10, or 30 minutes.

A confirmation screen appears to confirm the action. Once opened, turn the camera off to close the shutter again. Sony.
